For Immediate Release:

Governor DAO is excited to announce its partnership with Finnovant, an innovative biometrics firm that provides authentication services and innovative blockchain solutions.

Finnovant, Inc. offers biometric authentication technology through their “Say-Tec” solution, where **users can register, authenticate, and verify their identity through the use of voice and facial recognition**. Say-Tec secures sensitive information by replacing traditional, fraud prone access conventions like ID and password, with secure, user friendly biometrics.

“We are thrilled to partner with Governor DAO to offer a highly secure authentication platform combined with Governor DAO’s expertise in delivering blockchain governance solutions,” said Brian Maw, CEO Finnovant. “Our focus is to work with best of breed technology companies like Governor DAO and we are committed to helping our mutual clients grow and improve their business with innovative solutions.”

Finnovant’s innovative system is an exciting prospect for Governor DAO in aiding its mission to better provide decentralized governance to other cryptocurrency projects through their **Governance-as-a-Service** initiative.

By leveraging Finnovant’s Say-Tec, Governor DAO will create a portal that attaches a “Proof-of-Existence” label to the address supplied by a user who successfully authenticates as a unique individual. Through this synergy, Governor and Finnovant will create an infinitely portable, **universal whitelist that any project can leverage** to guarantee one-account-one-user for the likes of governance voting, airdrops and giveaways, capped token sales and yield farming, and much more.

Since the beginning of blockchain, the space has grappled with navigating sybil attacks (where one user can gain an unfair advantage under many identities) in a permissionless environment since inception. This is the **first non-intrusive, seamless, no-KYC sybil defense** that is applicable to any smart contract on Ethereum.

Biometric information is hashed and encrypted. Human eyes only see the mathematical hash of the data and have no means to decipher its origin (similarly to how users can't derive private keys from a wallet's public address). Any user worldwide is eligible to verify their "existence" and receive a "Proof-of-Existence" moniker that any other smart contract can check with just one additional line of code. Both firms believe that this **first-of-its-kind partnership to synergize blockchain and biometrics will have a profound impact on the future of the blockchain** space as the teams work to build out this crucial need that has remained unsolved for the past decade-plus.

Governor DAO, LLC is a Decentralized Autonomous Organization that provides governance as a service to blockchain projects of all sizes. By creating a token holder centered cryptocurrency, GDAO has created a safe and transparent DAO that emphasizes community growth and involvement.

Finnovant Inc. was founded in 2018 with the vision of helping business leaders dramatically improve the way they interact with their critical information and their customers. Our focus has been on developing emerging technologies with secure blockchain solutions including the Phenix X1 crypto mining smartphone, Password Protection Manager and crypto wallet. To ensure these technology environments are secure, Finnovant provides biometric authentication which also helps thwart Identity Theft and Fraud.
